

Experiment - 12

Aim:

To implement echo client server using TCP/UDP Search

Algorithm:

Server - py:

- Create a UDP socket
- Bind the socket to specific IP address (127.0.0.1) & port (12345)
- Continuous listen for incoming message
- when message received - decode it
- Repeat infinitely

Client - py

- Create UDP socket
- Set a timeout for socket to avoid waiting
- If no response received in period, print timeout message
- Close socket after sending message.

Code:

server.py

import socket

```
def start_server(host='127.0.0.1', port=12345):
```

```
    with socket.socket(socket.AF_INET, socket.SOCK_DGRAM) as s:
```

```
s.bind((host, port))
```

```
    print(f"UDP Server running on host {host} port {port}")
```

```
    while True:
```

```
        data, addr = s.recvfrom(1024)
```

```
        print(f"Received message from {addr}: {data.decode('utf-8')}")
```

```
if __name__ == '__main__':
```

```
    start_server()
```

client.py

```
def ping_server(host='127.0.0.1', port=12345):
```

```
    with socket.socket(socket.AF_INET, socket.SOCK_DGRAM) as s:
```

```
        s.settimeout(5)
```

```
        try:
```

```
            s.sendto(b'Hello', (host, port))
```

```
            print("Message sent to server")
```

```
        except socket.timeout:
```

```
            print("Request timed out")
```

```
if __name__ == '__main__':
```

```
    ping_server()
```

O/P:

server.py

Terminal

> python server.py

>>

UDP server running on 127.0.0.1:12345

Client - Py

Terminal

> python Client.py

>>

message sent to server

Server terminal:

Received message from (127.0.0.1:56003):
Hello

Result:

Thus the program of echo client server
using UDP sockets has been implemented
& executed successfully.
